JSONPath Syntax

Last modified on November 22, 2021

JSONPath is a query language for JSON, similar to XPath for XML. AlertSite API endpoint monitors (create.html) let you use JSONPath in assertions (assertions.html) to specify the JSON fields that need to be verified.

JSONPath notation

A JSONPath expression specifies a path to an element (or a set of elements) in a JSON structure. Paths can use the dot notation:

```
$.store.book[0].title
```

or the bracket notation:

```
$['store']['book'][0]['title']
```

or a mix of dot and bracket notations:

```
$['store'].book[0].title
```

Note that dots are only used before property names not in brackets.

The leading `$` represents the root object or array and can be omitted. For example, `$.foo.bar` and `foo.bar` are the same, and so are `$(0).status` and `[0].status`.

Other syntax elements are described below.

Expression	Description
<code>\$</code>	The root object or array.
<code>.property</code>	Selects the specified property in a parent object.
<code>['property']</code>	Selects the specified property in a parent object. Be sure to put single quotes around the property name. Tip: Use this notation if the property name contains special characters such as spaces, or begins with a character other than <code>A..Za..z_</code> .
<code>[n]</code>	Selects the <i>n</i> -th element from an array. Indexes are 0-based.
<code>[index1, index2, ...]</code>	Selects array elements with the specified indexes. Returns a list.
<code>..property</code>	Recursive descent: Searches for the specified property name recursively and returns an array of all values with this property name. Always returns a list, even if just one property is found.
<code>*</code>	Wildcard selects all elements in an object or an array, regardless of their names or indexes. For example, <code>address.*</code> means all properties of the <code>address</code> object, and <code>book[*]</code> means all items of the <code>book</code> array.
<code>[start:end]</code> <code>[start:]</code>	Selects array elements from the <i>start</i> index and up to, but not including, <i>end</i> index. If <i>end</i> is omitted, selects all elements from <i>start</i> until the end of the array. Returns a list.
<code>[:n]</code>	Selects the first <i>n</i> elements of the array. Returns a list.
<code>[-n:]</code>	Selects the last <i>n</i> elements of the array. Returns a list.
<code>[?(expression)]</code>	Filter expression. Selects all elements in an object or array that match the specified filter. Returns a list.
<code>[(expression)]</code>	Script expressions can be used instead of explicit property names or indexes. An example is <code>[(@.length-1)]</code> which selects the last item in an array. Here, <code>length</code> refers to the length of the current array rather than a JSON field named <code>length</code> .
<code>@</code>	Used in filter expressions to refer to the current node being processed.

Notes:

- JSONPath expressions, including property names and values, are **case-sensitive**.
- Unlike XPath, JSONPath does not have operations for accessing parent or sibling nodes from the given node.

Filters

Filters are logical expressions used to filter arrays. An example of a JSONPath expression with a filter is

```
$.store.book[?(@.price < 10)]
```

where `@` represents the current array item or object being processed. Filters can also use `$` to refer to the properties outside of the current object:

```
$.store.book[?(@.price < $.expensive)]
```

An expression that specifies just a property name, such as `[?(@.isbn)]`, matches all items that have this property, regardless of the value.

Below are the operators that can be used in filters.

(/) Support (/)

 Supported operators depend on the monitor playback engine (../readyapi-versions.html).

Operator	Description
==	<p>Equals to. String values must be enclosed in single quotes (not double quotes): [?(@.color=='red')].</p> <p>Note: Number to string comparison works differently depending on the playback engine (../readyapi-versions.html). In TestEngine, 1 does not equal '1'. In ReadyAPI 1.9 and earlier, 1 equals '1'.</p>
!=	Not equal to. String values must be enclosed in single quotes: [?(@.color!='red')].
>	Greater than.
>=	Greater than or equal to.
<	Less than.
<=	Less than or equal to.
~=	<p>Matches a JavaScript regular expression (https://developer.mozilla.org/en-US/docs/Web/JavaScript/Guide/Regular_Expressions). For example, [?(@.description =~ /cat.*/i)] matches items whose description starts with <i>cat</i> (case-insensitive).</p> <p>Note: Not supported if ReadyAPI 1.1 is used as the playback engine.</p>
!	<p>Used to negate a filter: [?!@.isbn] matches items that do not have the isbn property.</p> <p>Note: Not supported if ReadyAPI 1.1 is used as the playback engine.</p>
&&	<p>Logical AND, used to combine multiple filter expressions:</p> <p>[?(@.category=='fiction' && @.price < 10)]</p>
	<p>Logical OR, used to combine multiple filter expressions:</p> <p>[?(@.category=='fiction' @.price < 10)]</p> <p>Note: Not supported if ReadyAPI 1.1 is used as the playback engine.</p>
in	<p>Checks if the left-side value is present in the right-side list. Similar to the SQL IN operator. String comparison is case-sensitive.</p> <p>[?(@.size in ['M', 'L'])]</p> <p>[?('S' in @.sizes)]</p> <p>Note: Supported only by the TestEngine playback engine.</p>
nin	<p>Opposite of in. Checks that the left-side value is not present in the right-side list. String comparison is case-sensitive.</p> <p>[?(@.size nin ['M', 'L'])]</p> <p>[?('S' nin @.sizes)]</p> <p>Note: Supported only by the TestEngine playback engine.</p>
subsetof	<p>Checks if the left-side array is a subset of the right-side array. The actual order of array items does not matter. String comparison is case-sensitive. An empty left-side array always matches.</p> <p>For example:</p> <ul style="list-style-type: none">[?(@.sizes subsetof ['M', 'L'])] – matches if sizes is ['M'] or ['L'] or ['L', 'M'] but does not match if the array has any other elements.[?('M', 'L') subsetof @.sizes)] – matches if sizes contains at least 'M' and 'L'. <p>Note: Supported only by the TestEngine playback engine.</p>
contains	<p>Checks if a string contains the specified substring (case-sensitive), or an array contains the specified element.</p> <p>[?(@.name contains 'Alex')]</p> <p>[?(@.numbers contains 7)]</p> <p>[?('ABCDEF' contains @.character)]</p> <p>Note: Supported only by the TestEngine playback engine.</p>
size	<p>Checks if an array or string has the specified length.</p> <p>[?(@.name size 4)]</p> <p>Note: Supported only by the TestEngine playback engine.</p>
empty true	<p>Matches an empty array or string.</p> <p>[?(@.name empty true)]</p> <p>Note: Supported only by the TestEngine playback engine.</p>
empty false	<p>Matches a non-empty array or string.</p> <p>[?(@.name empty false)]</p> <p>Note: Supported only by the TestEngine playback engine.</p>

Examples

For these examples, we will use a modified version of JSON from <http://goessner.net/articles/JsonPath/index.html#e3> (<http://goessner.net/articles/JsonPath/index.html#e3>):

```
{
  "store": {
    "book": [
      {
        "category": "reference",
        "author": "Nigel Rees",
        "title": "Sayings of the Century",
        "price": 8.95
      },
      {
        "category": "fiction",
        "author": "Herman Melville",
        "title": "Moby Dick",
        "isbn": "0-553-21311-3",
        "price": 8.99
      },
      {
        "category": "fiction",
        "author": "J.R.R. Tolkien",
        "title": "The Lord of the Rings",
        "isbn": "0-395-19395-8",
        "price": 22.99
      }
    ],
    "bicycle": {
      "color": "red",
      "price": 19.95
    }
  },
  "expensive": 10
}
```

In all these examples, the leading \$. is optional and can be omitted.

Expression	Meaning
\$.store.*	All direct properties of store (not recursive).
\$.store.bicycle.color	The color of the bicycle in the store. Result: red
\$.store..price \$..price	The prices of all items in the store. Result: [8.95, 8.99, 22.99, 19.95]
\$.store.book[*] \$..book[*]	All books in the store.
\$..book[*].title	The titles of all books in the store. Result: [Sayings of the Century, Moby Dick, The Lord of the Rings]
\$..book[0]	The first book. Result: <pre>[{ "category": "reference", "author": "Nigel Rees", "title": "Sayings of the Century", "price": 8.95 }]</pre>
\$..book[0].title	The title of the first book. Result: Sayings of the Century
\$..book[0,1].title \$..book[:2].title	The titles of the first two books. Result: [Sayings of the Century, Moby Dick]
\$..book[-1:].title \$..book[(@.length-1)].title	The title of the last book. Result: [The Lord of the Rings] The result is a list, because [-n:] always returns lists.
\$..book[?(@.author=='J.R.R. Tolkien')].title	The titles of all books by <i>J.R.R. Tolkien</i> (exact match, case-sensitive). Result: [The Lord of the Rings] The result is a list, because filters always return lists.
\$..book[?(@.isbn)]	All books that have the isbn property.
\$..book[?!@.isbn]	All books without the isbn property.
\$..book[?(@.price < 10)]	All books cheaper than 10.
\$..book[?(@.price > \$.expensive)]	All expensive books.

Expression	Meaning
<code>\$.book[?(@.author =~ /.*Tolkien/i)]</code>	All books whose author name ends with <i>Tolkien</i> (case-insensitive).
<code>\$.book[?(@.category == 'fiction' @.category == 'reference')]</code>	All fiction and reference books.
<code>\$.*</code>	All members of the JSON structure beneath the root (child objects, individual property values, array items), combined into an array.

Considerations for JSONPath expressions that return multiple elements

JSONPath queries can return not just a single element, but also a list of matching elements. For example, given this JSON:

```
{
  "name": "Rose Kolodny",
  "phoneNumbers": [
    {
      "type": "home",
      "number": "954-555-1234"
    },
    {
      "type": "work",
      "number": "754-555-5678"
    }
  ]
}
```

the JSONPath expression

```
phoneNumbers[*].number
```

returns a list containing two phone numbers:

```
[954-555-1234, 754-555-5678]
```

Note that this is not a JSON array, it is just a comma-separated list of items where `[]` indicates the beginning and end of the list.

When using “equals” assertions against a list of matches, specify a list of expected values enclosed in `[]` and separated by a comma and one space:

```
[apples, 15, false, ["foo", "bar"], {"status": "ok"}]
```

Standalone strings (like `apples`) should not have enclosing quotes, unless the quotes are part of the value.

Example
(JavaScript:ShowExample("IDM5MMQY3TEHZ3II3HWNFO25ANWOEHQ3ZZ4JJWGOGW5P4BFEH421SP_id", "IDM5MMQY3TEHZ3II3HWNFO25ANWOEHQ3ZZ4JJWGOGW5P4BFEH421SP_div"))

Values that are JSON arrays and objects keep inner quotes, but are minified with no spaces between their items: `["foo", "bar"]` , not `["foo" , "bar"]` .

FAQ

How can I check that my JSONPath syntax is valid?

If you have ReadyAPI 1.9, you can create a test for your API endpoint, add a JSONPath Match assertion and test the syntax in the assertion editor there.

Otherwise, you can use <http://jsonpath.herokuapp.com> (<http://jsonpath.herokuapp.com>) and check the results on the Jayway tab. However, the syntax used on this site may be slightly different from the one used in AlertSite.
